# 1 Task 1

# 2 Task 2

design, train, evaluate PyTorch CNN to predict shown time.
data = 18.000 grayscale images (150*150 and 75*75)
labels = integer hour and minute displayed
split: 80% training, 10% validation, 10% testing
note: shuffle the dataset, files might be ordered.
prototype on 75*75 data and report on final 150*150 data.
approaches:

1. classification
2. regression
3. multi-head models in pytorch

compare them
evaluation metric
common sense error: absolute time difference between predicted and true time with 12-hour wrap-around. core objective is to minimize this error.
